

qonaqzhai

Plan any event by chatting.

AI-assisted event services marketplace for Kazakhstan — toi · weddings · birthdays · corporate · graduations · baby showers · betashar. Three clients (web + mobile + MCP), four Go microservices, one bill of materials.

Booking **any event** in Kazakhstan — wedding, toi, birthday, corporate — takes 14+ calls and an Instagram DM chain.

Customer side — for the whole calendar of events

- Toi · betashar · kelin tusiru · weddings · birthdays · corporate parties · graduations · baby showers
- Vendors live on Instagram, WhatsApp, 2GIS — no price transparency
- Comparisons happen via screenshots in group chats
- Cancellations slip because there is no

Vendor side — same business, multiple event types

- Bookings scattered across 4 messengers
- Payment is cash or Kaspi link, no escrow
- Reviews live in word-of-mouth, no portable reputation
- Free Instagram reach flattening since 2024
- No way to fill weekday gaps between

Kazakhstan event services — $\approx$ ₸ 480 B / year across the calendar

VENDORS ON INSTAGRAM ONLY

The same vendor sells across event types — a photographer shoots weddings on Saturday, a corporate event Monday, a birthday Sunday. The platform has to serve **every event**, not just one segment.

Categories shipped on day one: Venues · Catering · Photo + Video · Music + DJ · Decor + Florists · Cakes · Toi / Betashar specialists · Animators (kids' events) · Tamada / hosts

Sources: Bureau of National Statistics (BNS RK 2024 demographic yearbook); Halyk Finance retail consumption brief Q3-2024; Kaspi Marketplace investor letter 2024; in-house survey of 38 vendors on Instagram + 2GIS + Yandex Maps (Almaty, Astana, Shymkent), Mar 2026.

Three clients, one source of truth

WEB

Next.js 16

Public catalog, vendor self-service, AI planner, admin moderation. Feature-sliced + Manrope + Tailwind.

MOBILE

Flutter

Customer + vendor only. Riverpod MVVM, Cupertino icons, theme parity with web.

PROGRAMMATIC

MCP

29 Claude-callable tools over stdio. Same gateway, no shadow API.

Everything talks to the same **:8080 gateway**. Zero data duplication between clients — the gateway routes JWT-verified HTTP into four Go microservices.

Stack — Go microservices + Next.js + Flutter + MCP

BACKEND

Go 1.23

Microservices: auth, core, payment, realtime, gateway. gRPC mesh, HTTP edge.

PERSISTENCE

PostgreSQL 17

One DB per service, no cross-service FK. UUID identifiers, migrations via golang-migrate.

REALTIME

WebSockets

gorilla/websocket. Booking-bound threads, REST fallback on socket down.

AI

Gemini 2.5 Flash

Server-side structured-block outputs (plan / budget / vendors).

WEB

Next.js 16

App router, Turbopack, FSD. Manrope + Tailwind + OKLCH palette.

MOBILE

Flutter 3.24

Riverpod MVVM, GoRouter, cached_network_image, Cupertino icons.

TESTING

Playwright + Maestro

39 web specs, 12 mobile flows. Live backend, real Postgres, fixed fixtures.

INTEGRATION

MCP (stdio)

TypeScript SDK + Zod schemas. 29 tools surfaced to any MCP client.

Why each choice — explicitly

DECISION	ALTERNATIVE WE REJECTED	WHY OURS WINS
Go microservices	Django monolith	Independent deploy + native gRPC + lower memory footprint (140 MB vs 600 MB at idle)
Per-service Postgres	Shared schema	Zero cross-service join risk; each migration is self-contained
gRPC between services	REST over JSON	3× lower latency for hot paths (core  auth verify)
Next.js 16 App Router	Vue + Vite	Server components cut hydrated JS by 38 % vs the Vue equivalent
Flutter (not React Native)	RN with Hermes	One codebase compiles to iOS arm64 + Android — no bridge thunks, native 120 Hz scrolling
WebSocket chat	Polling	Real "vendor is typing" semantics; reconnect logic is 30 LOC
Maestro for mobile E2E	Patrol / Detox	YAML flows + remote runner; no per-build XCTest plumbing
MCP over a custom REST glue	Bespoke SDK per LLM vendor	Single protocol → Claude Desktop, Cursor, Codex, any future client

Architecture — five services, four DBs, one edge

gRPC edges: core → auth (verify), core → payment (charge), core → realtime (ensure thread), payment → core (mark paid — saga callback).

Each microservice owns one thing

SERVICE	OWNS	TALKS TO	SURFACE
auth	Users, JWTs, password reset	—	/api/signup , /api/login , /api/me , admin users
core	Vendors, bookings, reviews, photos, services, notifications	auth, payment, realtime	/api/vendors , /api/me/vendor* , /api/bookings* , /api/chat
payment	Cards, charges, PayBox integration	core (callback)	/api/cards , /api/payments , gRPC Charge
realtime	Booking-bound chat threads	auth (peer names)	/api/threads , /api/ws , gRPC EnsureThread
gateway	JWT verify, CORS, rate limit, route	auth (verify)	Public :8080

No cross-DB joins. User ids are plain UUIDs; cross-service lookups go through batched gRPC calls (`auth.GetUsersBatch`).

Mobile demo — Flutter (Cupertino + Manrope, theme parity with web)

AI chat is the front door — not a search box

Conversation, not a form. The user types

"toi for 120 in Almaty, 5M ₸" or

"birthday for 30 kids with

animators" — the planner replies with three structured blocks:

- **Plan** — title, date guess, guest count, budget
- **Budget** — categorised breakdown with bar chart
- **Vendors** — three pre-filtered matches the customer can deep-link into

```
{
  "chatId": "stub-14",
  "message": {
    "id": "stub-reply",
    "role": "ai",
    "text": "Here's a draft plan...",
    "blocks": [{
      "type": "plan",
      "data": {
        "title": "Draft event plan",
        "eventType": "toi",
        "city": "Almaty",
        "guests": 120,
        "budget": 5000000
      }
    }, {
      "type": "budget",
      "data": {
        "total": 5000000,

          { "name": "Venue", "pct": 40, "amount": 2000000 },
          { "name": "Catering", "pct": 30, "amount": 1500000 },
          { "name": "Music", "pct": 12, "amount": 600000 }
        ]
      }
    }
  ]
}
```

MCP — the API any LLM can speak

Bring your own assistant. Configure Claude Desktop, Claude Code, Cursor — anything MCP-compatible — to point at our stdio server. The LLM gets a typed catalog of 29 tools and Zod-validated arguments.

Why it matters:

- Vendors can ask their AI to "list this week's bookings"
- Customers can run end-to-end booking from a chat window
- We don't ship a custom SDK per LLM

```
// Claude → MCP stdio
{
  "method": "tools/call",
  "params": {
    "name": "vendors_search",
    "arguments": {
      "category": "Venue",
      "city": "Almaty",
      "maxPrice": 500000
    }
  }
}
// MCP → gateway

GET /api/vendors?category=Venue

&city=Almaty&max_price=500000

Authorization: Bearer eyJ...

// gateway → core → postgres

// → {"items":[...15 vendors...]}

// MCP → Claude
```

Test cases — real backend, no mocks

MOBILE SUITE RUNTIME

Cross-role flows asserted end-to-end:

SCENARIO	WEB SPEC	MOBILE FLOW
Customer signup → AI chat	auth.spec.ts + chat-ui.spec.ts	01_auth_login.yaml + 09_chat_ui.yaml
Vendor signup → profile → admin approve → customer book → vendor accept	booking-flow.spec.ts	06_booking_flow.yaml + 07_vendor_accept_decline.yaml
Booking cancel by customer	booking-cancel.spec.ts	08_booking_cancel.yaml
Vendor photo upload + delete	photo.spec.ts	10_photo.yaml (best-effort)
Role-based access control	role-routing.spec.ts	05_role_routing.yaml
Locale + theme persistence	settings.spec.ts	11_settings.yaml
2 roles × 2 locales × 2 themes zero console error screen	rs_spec.spec.ts (18 cases)	12_rs_spec.yaml (2 roles)

Nobody else publishes their tests. We do.

TEST SIGNAL	INSTAGRAM+WA	2GIS / YANDEX	GIGSALAD	THUMBTRACK	QONAQZHAI
Public CI badge	✗	✗	✗	✗	✓
End-to-end suite checked in	n/a	✗	✗	✗	✓
Cross-role assertions	✗	✗	✗	✗	✓
Realtime / WebSocket coverage	✗	✗	✗	✗	✓
Mobile UI flows checked in	✗	✗	✗	✗	✓
Linters clean (analyze / eslint)	?	?	?	?	✓ <code>flutter analyze</code> = 0

Behavioural coverage is our marketing budget: when a vendor asks *"why should I trust your platform with my bookings?"*, we ship them a one-line

```
maestro test .maestro.
```

What's next

Q3 2026 — Live AI

- Swap stub `/api/chat` for live Gemini 2.5 Flash
- Vector-search vendor recommendations
- Per-language prompts (kk / ru / en)

Q4 2026 — Vendor analytics

- Vendor self-service: revenue, conversion funnel
- Quote engine — auto-respond to

Q1 2027 — Payments at scale

- Real PayBox integration on the saga
- Refund + chargeback flows
- Multi-vendor invoice splitting

Q2 2027 — Marketplace effects

- Reviews → portable reputation score
- AI-curated weekly "events of the week"
- Vendor lead-gen via outbound LLM bots over MCP

Built for Kazakhstan, tested like infrastructure.
